Green Concept

Course Care
The Turf Professional's Choice

THE COST EFFECTIVE WETTING AGENT

Green free of dry patch or compaction problems.

Green Concept is an advanced, non-ionic wetting agent, the type widely recognised as best for your turf (persists in the soil and is the least phytotoxic) It will help to prevent water running off or evaporating before reaching the root zone.

Green suffering from compaction or dry patch.

Water unable to penetrate through a flooded green. The use of Green Concept would be beneficial, allowing greater water mobility and more uniform wetting.

Green Concept

The cost effective wetting agent

Why use *Green Concept* ?

- *Green Concept* will reduce the formation of dew on the sward.
- *Green Concept* keeps the turf surface drier and less susceptible to disease.
- *Green Concept* can enhance root development.
- *Green Concept* With new "Downpour" formulation allows water to pass through the thatch and hydrophobic zones.
- *Green Concept* will significantly reduce the surface tension of water droplets allowing greater water mobility and more uniform wetting.

Core samples have clearly demonstrated that untreated greens are often dry and crumbly where water hasn't penetrated. Samples from greens treated with an effective wetting agent, such as Green Concept, show thorough and uniform water penetration.

Treatment: 20 litres of Green Concept, when diluted, will treat one hectare of turf (typically 0.4 of a litre per average green).

Dilution: As Green Concept may be applied with other products, varying dilution rates can be used to suit. Dilution will also depend on soil conditions (usually between 50 and 150 parts water to 1 part Green Concept is acceptable)
